The by non-profit institutions as long ified and this statement is not removed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    as well as non-peptide, low molecular weight secretagogues (e.g. L-692,429, MK-0677, adenosine) (By similarity).
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ritted (JAN-2001) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Receptor for ghrelin, coupled to G-alpha-11 proteins.
Stimulates growth hormone secretion. Binds also other growth
hormone releasing peptides (GHRP) (e.g. Met-enkephalin and GHRP-6)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MOUSE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             99
                                                         SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: EXPRESSED MAXIMALLY IN THE CEREBELLUM,
HYPPOCAMPUS, PIRIFORM CORTEX AND NEOCOTIEX OF ADULT BRAIN.
DEVELOPMENTAL STAGE: EXPRESSED POORLY IN 7-DAY-OLD BRAIN.
EXPRESSION INCREASES AT DAY 15 TO REACH A MAXIMAL LEVEL IN 35-DAY-
SIMILARITY:
HIGHEST TO 7
                                                                                                                                                                               FUNCTION: RECEPTOR FOR THE TRIDECAPEPTIDE NEUROTENSIN. IT IS ASSOCIATED WITH G PROTEINS THAT ACTIVATE A PHOSPHATIDYLINOSITOL-
                                                                                                                                                                CALCIUM SECOND MESSENGER SYSTEM.

If Miznik H.B., Srikant C.B., Patel Y.C.;

If "Molecular cloning, functional characterization, and chromosomal localization of a human somatostatin receptor (somatostatin receptor functional receptor somatostatin receptor functions, RECEPTOR FOR SOMATOSTATIN-28. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH INHIBIT ADENVIYL CYCLASE.

INTESTINE LOCATION: Integral membrane protein.

INTESTINE LOW LEVELS IN ISLETS AND SPLEEN. NOT DETECTED IN KIDNEY, PANCREAS, CEREBELLUM, OR CORTEX.

SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                Pfam; PFO0001; TRN 11.
